

## SENDKIT DOCS

# The 14-day onboarding checklist: signup to first reply

New mailboxes need about two weeks of warm-up before they can carry real volume, on any platform. This checklist uses those two weeks well, so your first reply lands on schedule instead of three weeks late.

## Day 0 to 1: set up the shell

- ☐ Create your workspace, your isolated space for mailboxes, leads, and campaigns. It takes about two minutes.
- ☐ Add mailboxes by one of three routes: buy them in SendKit, import pre-warmed mailboxes from InboxKit, or connect what you already have.
- ☐ Warm-up starts automatically the moment mailboxes are added. Nothing to switch on.

**On track when:** mailboxes are in and warm-up is running in the background.

## Days 1 to 14: warm up while you build

- ☐ Let warm-up run. Health scores are shown honestly, so expect a climb to around 96 to 97 over the two weeks, not a 100 on day one.
- ☐ Pause cold sending on any mailbox that drops below 95 health until it recovers.
- ☐ Run warm-up in one tool only. Doubling it up does not warm faster; it confuses the signal and can trigger spam flags.
- ☐ On Microsoft or Azure mailboxes, expect a slower ramp. It starts at 1 email a day on purpose, because Microsoft's limits are tighter.
- ☐ Do your mailbox math: daily volume divided by 15 sends per mailbox, 3 mailboxes per domain.
- ☐ Import and validate your leads, write your first sequence, and leave campaign settings on auto.

**On track when:** health scores are climbing, leads are validated, the sequence is written, and no spam-landing alerts sit unresolved.

## Day 14 onward: launch and scale

- ☐ Launch the campaign and read the sending schedule, so you know exactly what goes out each day.
- ☐ Handle replies in Unibox, with the AI reply agent taking the first pass.
- ☐ Measure positive reply rate, the only number that predicts growth. SendKit does not track opens or links, because bot opens make those numbers lie.
- ☐ If bounce rate creeps above 2.5%, stop and revalidate the list before sending more.
- ☐ When your target outgrows 15 sends per mailbox per day (20 once fully warmed), add mailboxes rather than pushing one harder.

**On track when:** health is above 95, bounces are under 2.5%, and positive replies are arriving.

### WHY THE TIMELINE HOLDS ON SENDKIT

Every mailbox runs on its own isolated dedicated IP and health scores are transparent, so you see exactly how warm-up is actually going. That is what lets you trust day 14.

### Start day one now

Create your workspace and add your first mailboxes today. Warm-up begins the moment they land, and day 14 only gets closer once it does.
