

SENDKIT DOCS

Campaign best practices inside SendKit

The habits that separate healthy campaigns from risky ones: keep the automation on, let priority manage shared capacity, and keep follow-ups disciplined.

Keep the settings tab on auto

The settings tab is where most of SendKit's advantage lives. For almost everyone, the right move is to leave each default on.

Timezone auto-mapping

SendKit reads each lead's country, state, and city and emails them during their own 9-to-5, never yours.

[LEAVE IT ON](#)

Holiday skip

National holidays in each lead's region are skipped automatically. A holiday email reads as tone-deaf for zero upside.

[LEAVE IT ON](#)

ESP matching

Matches your sending provider to the lead's receiving provider, Gmail to Gmail or Outlook to Outlook. Not a guaranteed win, but it costs nothing and can only help.

[LEAVE IT ON](#)

Copy fatigue protection

When bounce or block signals cross a threshold on a message, SendKit auto-rotates the wording before you would notice a dip.

[LEAVE IT ON](#)

SEG handling. Secure email gateways such as Proofpoint, Barracuda, and Mimecast sit in front of some inboxes. SendKit detects these leads so you can skip them entirely. Keep it on skip all unless your whole ICP is enterprise; sending into SEGs at scale mostly wastes sends.

Priority and the sending schedule

When campaigns share mailboxes, each mailbox still sends only 15 cold emails a day, up to 20 once it has warmed for about two weeks. Set each campaign to High, Normal, or Low and SendKit auto-splits that shared daily volume; a High campaign gets first claim each day. There is no manual per-campaign cap, by design, so the sending algorithm stays free to optimize pacing.

Right after launch, open the sending schedule view and check today versus tomorrow. A low number for today usually just means most of your leads' local business hours have already passed; those sends roll into tomorrow's queue automatically. Leads without location data fall back to your mailbox's default window.

Follow-up discipline with subsequences

A subsequence fires automatically off a reply's sentiment or tag, for example an automatic follow-up template when a lead is tagged interested. It lives in the same sequence editor as your main steps. Its delay is a campaign-level setting: every qualifying lead waits the same time, which keeps the editor predictable. When timing must flex lead by lead, use the AI reply agent's follow-ups-only mode instead; it reads each conversation and times its follow-up from what that lead actually said.

THE HEALTHY-CAMPAIGN PATTERN

Auto settings on, priority set deliberately across shared mailboxes, schedule checked after launch, subsequences for consistent follow-ups, and the reply agent when timing needs to flex per conversation.

Audit your active campaign against this list

Open your campaign's settings tab, priority, schedule view, and subsequences, and check each item above.
