

Run SendKit from Claude: the MCP quickstart

SendKit ships an MCP server, so Claude or any MCP-compatible tool can operate the platform directly. Campaign setup, lead management, and reply handling move into the same agent workflows you already build elsewhere.

What you can drive from Claude

Campaigns

Create and configure campaigns from a chat interface or an agent workflow instead of clicking through the dashboard.

Leads

Import and manage leads, with batch endpoints for volume work instead of one-at-a-time calls.

Replies

Read incoming replies, tag them, and send responses from the same session.

The AI reply agent

Controllable the same way: it responds automatically above a confidence threshold you set, alongside the manual dashboard controls.

MCP covers roughly 95% of the full API surface. Deletes are the deliberate exception, kept out of MCP as a safety boundary so an agent can never hallucinate its way into removing a campaign or a lead list. When you need to delete something, do it from the dashboard or the API directly.

Prefer scripts? There is a CLI

A CLI covers the same core operations, campaigns, leads, and replies, without an MCP client. It is the better fit when your workflow already runs on cron jobs or CI pipelines rather than an agent runtime.

Limits worth knowing before you automate

Limit	Value
API rate limit	1,250 requests per minute, global across your account and shared by every key and integration you run
Batch lead endpoint	Up to 5,000 leads per API call
CSV import	Up to 50,000 leads per file
Plan gating	None. MCP and the CLI are available on every plan, from \$99 Essential up

Batch where you can. Looping single-lead calls burns the same shared rate limit thousands of times over.

WHY ISOLATED INFRASTRUCTURE MATTERS FOR AUTOMATION

Automation multiplies whatever infrastructure it runs on. Every SendKit account sends from its own isolated, dedicated infrastructure, so an agent scaling your campaigns scales only your reputation, never a stranger's, and real, unfaked health scores give that agent a truthful signal to act on.

Connect Claude to your workspace

Generate an API key from Settings, add the SendKit MCP server to Claude, and make your first call: create a draft campaign and push a test batch of leads into it.
