

The SendKit CLI, at a glance

The SendKit CLI puts campaigns, leads, mailboxes, analytics, and more behind a single terminal command. Install it once, authenticate, and every workspace action below is a command away.

Install and authenticate

01 Install

```
npm i -g @sendkit-ai/cli
```

02 Log in

`sendkit auth login --key <your-api-key>`. Omit `--key` and the CLI prompts for it. `sendkit auth whoami` confirms who you are authenticated as; `sendkit auth logout` clears stored credentials.

03 Every command supports

`--json` for raw output, `--api-key` to override the stored key for one call, and `--workspace` to target a workspace other than your active one.

Command groups

auth, workspaces
Login, session, and workspace management.

campaigns, campaign-leads
Create, list, start, pause, resume, duplicate, and analyze campaigns; manage the leads inside one.

leads, dnc, enrichment, tags
Create, import, export, search leads; manage the Do Not Contact list, enrichment jobs, and AI tagging labels.

mailboxes, warmup, testing
Mailbox management, warmup stats, and inbox placement or blacklist tests.

inbox, agents, templates
Inbox conversations, AI reply agents, and email templates.

analytics, webhooks, integrations
Reporting, webhook management, and CRM or third-party integrations.

Three commands to try first

Command	What it does
<code>sendkit campaigns list --status active --limit 10</code>	Lists your 10 most recent active campaigns.
<code>sendkit leads import leads.csv --tag q3-outbound</code>	Imports a CSV of leads and tags every row on the way in.
<code>sendkit analytics daily --from 2026-07-01 --to 2026-07-12</code>	Pulls daily analytics for a date range.

Every command group and subcommand has its own help: run any group name with `--help`, for example `sendkit campaigns --help`, to see its full option list.

Run your first CLI command
Install the CLI, run `sendkit auth login`, then try `sendkit campaigns list` to see your workspace from the terminal.

Run your first command
