

SENDKIT DOCS

High bounces on a new campaign

It's normal for a brand new campaign to show a rough bounce rate in its first batch of sends. What matters is whether that number settles.

Why launches spike

The first 100 to 300 emails of a new campaign are effectively a live test of the list against real inboxes. If the bounce rate looks high in that window and then drops as the campaign keeps sending, that's the list and the mailboxes finding their footing together, not a sign something is broken. This settling period is expected, which is why you shouldn't judge a campaign off its first hour of sends.

Auto-pause is doing its job

SendKit automatically pauses a campaign when bounces cross a set threshold, before the damage spreads further into your list. Seeing a campaign paused right after launch isn't a bug, it's the safeguard working as intended. If you've checked the paused sends and they look like an early-campaign blip rather than a real list problem, you can re-enable sending and let the campaign continue.

Resume or revalidate

Re-enable and continue

The bounce spike was in the first 100 to 300 sends, and the rate is visibly dropping as more of the campaign goes out.

[RESUME SENDING](#)

Stop and fix the list

The bounce rate stays sustained above 2.5% well past that early window. A rate that won't come down on its own is telling you about the list, not about bad luck.

[REVALIDATE FIRST](#)

How to revalidate

Run the list back through SendKit's built-in email validation, or a validator like BounceBan alongside it, before resuming sends to the remaining leads. This clears out the addresses actually driving the bounce rate instead of just pausing and hoping it improves on its own.

WHY THIS WORKS ON SENDKIT

Every mailbox sends through its own isolated IP, so one rough campaign launch doesn't put reputation risk on the rest of your infrastructure while the list settles.

Pause and run the first two checks now

Confirm the spike falls in the first 100 to 300 sends and that the rate is dropping, then decide to resume or revalidate.
