

SENDKIT DOCS

Reaching Gmail and Yahoo inboxes

If a list is heavy on personal Gmail, Yahoo, or Outlook addresses, here is what to actually expect, and what not to.

Reply rates on personal inboxes are just lower

This isn't specific to SendKit. Across the cold email industry, reply rates on personal email addresses, the free consumer accounts, not business domains, run far below what you'd see reaching the same person at their work email. Personal inboxes get flooded with promotional and spam content, and providers filter far more aggressively around them than around business inboxes.

No platform has solved this

Every cold email tool sending to personal addresses runs into the same wall. There's no rotation trick, IP change, or sending pattern that reliably fixes personal inbox performance, because the filtering happens on the receiving provider's side, not the sending side. Any platform claiming to have cracked personal email deliverability is overselling a problem the entire industry is still up against.

What actually helps

01 Target business emails where you can

If a lead has both a personal and a work email on file, the work email is almost always the better bet for cold outreach.

02 Treat it as a lower-expectation list, not a broken campaign

Softer reply numbers don't mean something is wrong with your setup, they reflect the channel.

03 Still check hard bounces and health scores

A personal-heavy list deserves the same basic hygiene checks as any list; they just won't get you to business-inbox reply rates no matter how clean the setup is.

What this means for list building

If reply rate is the goal, and it should be, over opens or clicks, weighting your lead sourcing toward verified business emails will do more for your numbers than any sending tweak. This is a list composition decision more than a deliverability one.

WHY THIS WORKS ON SENDKIT

SendKit shows real, unfaked health scores and hard bounce data per mailbox, so you can see clearly how a personal-heavy list is actually performing rather than guessing from reply counts alone.

Check your placement on personal-inbox seeds

Run an inbox placement test that includes personal Gmail and Outlook seeds alongside your business seeds, then compare the two segments.
