

SENDKIT DOCS

Building your AI reply agent

The reply agent reads, tags, drafts, and can send replies for you. Setup comes down to three choices: the mode, the confidence threshold, and the knowledge base it drafts from.

Choose a mode per campaign

01 Off

The agent does not touch replies at all.

02 Follow-ups only

The agent handles follow-up timing and drafting on replies already in a conversation, but never originates new outbound touches.

03 Full

The agent reads, tags, drafts, and sends replies end to end, within your confidence threshold.

You can override the mode per individual conversation, so one high-stakes thread runs manually while the rest of the campaign stays on Full.

Set the confidence threshold

The threshold, roughly 90 percent, is the line between automatic and manual. Above it, the agent sends its drafted reply on its own. Below it, the draft waits in your queue for approval before anything goes out. Every automated reply also carries a built-in cooldown of 5 to 6 minutes, so responses feel like a person typing rather than an instant bot reply.

Build the knowledge base

- Upload your product docs, FAQs, and pricing pages as source material; the agent also pulls what it can by scraping your domain directly.
- PDFs parse into the knowledge base more reliably than DOC files. If you have both, upload the PDF.
- Put your signature in the Additional Information field, not inside a template document. The agent pulls from Additional Information when composing, so every draft includes it consistently.

Review before you trust it

Manually review the agent's drafts and sends for the first week or two after launch, especially in Full mode. That is your window to catch anything the knowledge base does not cover before volume ramps. You can also set stop rules based on reply count, so the agent hands a conversation to a human after a set number of automated replies rather than running indefinitely.

PROOF IT WORKS

The AI reply agent has booked SendKit's own demo calls, and prospects on those calls could not tell they were not talking to a person.

Set up your reply agent

Pick a mode, set your confidence threshold, and upload your first knowledge base documents.
