The AI reply agent vs your Unibox manager

Unibox is where a human manages every reply in one place. The AI reply agent is an operator you can layer on top of it. Here is what each one does and when to keep a human in the loop.

What the Unibox is

Unibox pulls replies from all your connected mailboxes into a single unified view, so you never log into ten inboxes to see who answered. Replies arrive tagged automatically: interested, waiting, out of office, pricing question, meeting request. Auto-replies such as out-of-office responders are filtered out of the main view, so you are only looking at real human responses. Each reply also shows the lead's local time; if their clock reads 2:48am, Unibox flags it so you wait for their morning instead of firing back instantly.

What the agent adds

Job	Unibox alone	With the reply agent
Tagging	Replies arrive auto-tagged; you work the queue	The agent reads and tags incoming replies as part of drafting
Replying	You write every reply by hand	Above your confidence threshold the agent sends on its own; below it, drafts wait for your approval
Follow-ups	You track who needs a nudge	Follow-ups-only mode times and drafts follow-ups per conversation from what each lead said
Pacing	You choose when to respond	A 5 to 6 minute cooldown on automated replies keeps responses feeling human

Tune the threshold to the stakes: commonly tighter, around 95, for something finance-sensitive, and looser, around 80 to 90, for lower-stakes replies. On credits: reading and manually writing replies costs zero, template-based automatic replies cost zero, and only fully AI-generated replies draw from your balance at 5 credits per reply.

When a human should stay in the loop

- **The first week.** Review every AI-drafted reply manually before it sends, even those above threshold, while the knowledge base absorbs your product details and tone.
- **High-stakes threads.** Override the mode per conversation to pull a single thread into manual control while the campaign stays on Full.
- **Long conversations.** Set stop rules by reply count so the agent hands off to a human after a set number of automated replies.
- **Everything below threshold.** Low-confidence drafts always wait in your queue; that approval pass is yours.

Turn on the agent for one campaign and compare
Run one campaign with the agent on and judge the drafts against your own Unibox workflow for a week.
