

Understanding SendKit settings

The campaign settings tab is where most of SendKit's advantage over other tools actually lives. For almost everyone, the right move on every setting below is the same: leave the default on and let it run. Here is what each one does, and the few cases where overriding makes sense.

Timezone auto-mapping

SendKit reads each lead's country, state, and city and maps their local timezone automatically. A lead in Mumbai and a lead in Miami in the same campaign each get emailed during their own 9-to-5, never yours.

Keep it on auto. Manually scheduling around timezones becomes unmanageable the moment your list spans more than one country.

Holiday skip

SendKit knows the national holidays for the regions your leads sit in and skips sending on those days automatically. No calendar tracking on your end.

Keep it on auto. An email landing on a public holiday reads as tone-deaf and mostly gets ignored or reported, for zero upside.

ESP matching

Matches your sending provider to the lead's receiving provider, Gmail to Gmail or Outlook to Outlook, when you tick the box or hit auto-match. Honest framing: ESP matching is not a guaranteed deliverability win. Some months it helps, some months it does not move the needle.

Keep it on auto. It costs nothing to enable and can only help, never hurt, so there is no real case for turning it off.

Copy fatigue protection

When bounce or block signals cross a threshold on a specific message, SendKit auto-rotates the wording to get you back into inboxes, without you touching the sequence or noticing a dip first.

Keep it on auto. It catches spam-filter flags in real time, faster than you could manually spot the problem and rewrite a line.

SEG handling

Secure email gateways, the enterprise filters like Proofpoint, Barracuda, and Mimecast, sit in front of some inboxes. SendKit detects the leads behind them and lets you skip those leads entirely, or target only specific mailboxes or ESPs at them.

Keep it on "skip all," with one override. If your whole ICP is enterprise, targeted sending into SEGs is the exception worth configuring. Otherwise, sending into SEGs at scale mostly wastes sends that were never going to land.

THE DEFAULT POSTURE, IN ONE LINE

Timezone auto-mapping on, holiday skip on, ESP matching on, copy fatigue protection on, SEG handling on "skip all." Set once at campaign creation, then never touch it again. The only setting with a real override case is SEG handling, and only when your entire ICP sits behind enterprise gateways.

Timezone and holiday auto-handling mean you never build region-by-region send schedules by hand, and copy fatigue protection rotates wording before you would notice a problem. Two minutes in the settings tab confirms all five are doing their job.
