

SENDKIT DOCS

The Slack integration

SendKit's two-way Slack integration puts campaign replies where your team already talks, and lets you reply from Slack itself, not just from the dashboard.

What lands in Slack

Once connected, replies to your campaigns land directly in a Slack channel you choose, not just the SendKit Unibox. Reply tags, interested, waiting, out of office, pricing question, meeting request, carry over into what posts to Slack, so your team can scan a channel and immediately see which replies need attention versus which are just auto-replies or out-of-office notices.

Setting it up

01 Go to Settings, Integrations, and select Slack

02 Authorize the connection to your Slack workspace

03 Choose which channel replies should post to

Route all campaigns to one channel, or set this up per campaign if different teams should watch different lists.

04 Send a test reply from a lead's conversation

Confirm it lands in the right channel.

05 Reply to that test message from Slack

Confirm it shows up back in Unibox as sent.

Triage from Slack

This is genuinely two-way: Slack is not just a notification feed, it is a working reply surface. Respond to a lead straight from Slack, and that reply sends from the right mailbox in the right thread, the same as if you had typed it in the dashboard. This matters most for teams where the person reading replies first, an SDR, a founder, a support lead, is not always logged into the SendKit dashboard, but is always in Slack.

KEEP SHARED CHANNELS CLEAN

If you run several campaigns and only want certain ones in Slack, a client's campaign kept separate from internal testing, for instance, set the Slack connection per campaign rather than account-wide. That keeps a shared channel from getting noisy with conversations your team does not need to see.

Connect your reply channel

Go to Settings, Integrations, connect Slack, and send a test reply to confirm the loop works both ways.
