

SENDKIT DOCS

The three mailbox routes: buy, import, or connect

Your workspace is empty until it has mailboxes. There are three ways to fill it, and which one fits depends on what you already have.

01 Buy inside SendKit

The simplest route if you are starting fresh. Pick Google or Outlook, choose how many mailboxes and domains you need, and check out. When you buy Google mailboxes, SendKit sets up a dedicated Google Cloud client ID behind the scenes for your account, part of keeping your sending infrastructure isolated from every other customer. Provisioning takes 10 to 20 minutes to finish in the background. Do not refresh, retry, or re-add the mailbox while it sets itself up; clicking around usually delays it further.

02 Import from InboxKit

If you already have mailboxes with InboxKit, connect them with an API key. Paste the key in and SendKit auto-detects your InboxKit mailboxes and pulls them in, no manual entry per mailbox. This route is common for agencies who buy mailbox infrastructure from InboxKit and run campaigns from SendKit.

03 Connect existing mailboxes via SMTP

Already running mailboxes somewhere else, Google Workspace or a custom provider? Go to Mailboxes, click Connect existing, enter your SMTP (and IMAP, for receiving replies) credentials, and SendKit verifies the connection and pulls the mailbox in. This is the route for migrating an existing setup instead of buying new.

Which route should you pick

Starting from zero

Buy inside SendKit. You get isolated infrastructure provisioned for you without assembling anything by hand.

Already on InboxKit

Import with the API key. SendKit pulls in every InboxKit mailbox automatically, no manual entry.

Already running mailboxes elsewhere

Connect via SMTP if you do not want to abandon infrastructure you already own and trust.

Not sure how many you need

Work out the count first using mailbox math (15 sends per mailbox per day, 3 mailboxes per domain) before you buy or connect anything.

WHY THIS WORKS ON SENDKIT

However you get your mailboxes in, they run on isolated dedicated infrastructure unique to your account. Nobody else's sending behavior shares an IP with yours, and nobody else's mistakes affect your inbox placement.

Next step

Once mailboxes are added, warm-up starts automatically. It takes about two weeks to build the sending reputation a mailbox needs before real campaign volume.

Add your first mailboxes

Open Mailboxes in your workspace and choose buy, import from InboxKit, or connect via SMTP.
