Unibox basics: tags, filters, and the reply workflow

Once your sequence lands, every reply across every mailbox flows into one place: Unibox. You do not need to log into ten different inboxes to see who answered.

One inbox for every mailbox

Unibox pulls replies from all your connected mailboxes into a single unified view, tagged automatically: interested, waiting, out of office, pricing question, meeting request. Auto-replies, like out-of-office responders, get filtered out of the main view, so you are only ever looking at real human responses.

Filtering to what matters

Work the tags

Filter the view down to Interested or Pricing question first. Those are the replies worth a same-day answer.

Skip the noise

Out-of-office and other auto-replies are already excluded from the main view, so your queue only shows conversations that need a person.

Local time per lead

Each reply shows the lead's local time, not yours. If a lead's clock reads 2:48am, Unibox flags it, so you know to hold off on an instant reply and wait for their morning instead. Replying at a human hour, in their timezone, reads far more human than an instant response at 3am their time.

The reply workflow

- Open a conversation from the tagged queue and read the thread in full before replying.
- Check the local-time flag before you send; hold overnight replies until the lead's morning.
- Reply manually from Unibox the same way you would from any inbox. Reading and writing replies by hand costs nothing, the same as sending and creating campaigns.
- Move to the next tagged conversation once a thread is answered or resolved, so the queue reflects what still needs attention.

THE HABIT

Work Unibox by tag, not by mailbox. A tagged queue across every connected mailbox is faster to clear than checking inboxes one at a time, and the local-time flag keeps replies landing at a human hour.

Clear today's replies using tag filters

Open Unibox, filter to Interested and Pricing question, and work through those conversations first.
