

SendKit vs Apollo

The short version: Apollo is a data platform first, one of the largest B2B databases, with a sequencer attached. But the sending runs entirely through the mailboxes you connect: 250 emails per day and a single mailbox on the Free and Basic tiers, per-seat pricing with a three-seat minimum at the top, and no blacklist monitoring or placement testing anywhere. Its own reviewers close the loop, the most-cited complaint is stale data, and the bounces from it land on *your* domain reputation. SendKit is the sending layer Apollo doesn't have: dedicated IPs, isolation, and the full deliverability suite on every plan. Keep Apollo for data if you love it; send on real infrastructure.

	SendKit	Apollo
Sending infrastructure	Dedicated IPs and fully isolated sending on every plan, from \$99	None of its own, sends through your connected Gmail/Outlook/SMTP; sells domains and mailboxes in-app, but sending still rides them
Daily sending capacity	Scales with your mailboxes and plan; per-mailbox health guardrails	250 emails/day on Free and Basic; unlimited only from Professional (\$79/seat)
Mailboxes	Unlimited	1 on Free and Basic; unlimited Google/Microsoft + 5 SMTP on Professional
Domain risk	Cold volume runs on IPs allocated only to you, separate from your day-to-day domain	Cold volume rides the mailboxes and domains you connect, bounces from stale data hit your reputation
Warmup	Native: guardrails tuned per mailbox type, plus a high-quality seed pool used only with your mailboxes	Built-in warmup engine included on paid tiers, credit where due
Deliverability tools	Validation, blacklist monitoring, placement tests built in	Health scores and bounce tracking; no blacklist monitoring and no seed-list placement testing advertised
Pricing model	Flat platform price, unlimited team members	Per seat: \$49 / \$79 / \$119 (annual), Organization has a 3-seat minimum; cancellations take effect only at end of term
Lead data	Built in: 400M+ lead database	Very strong: 230M+ contacts, 30M+ companies, this is Apollo's core
CLI + MCP	Both. Hosted, unmetered, smart routing, 5-10x higher rate limits	Both exist, credit for shipping them; MCP free on any plan, but search/enrichment API calls burn plan credits and rate limits are unpublished, varying by tier
White-label	Full, from \$499: reports, login, URL, API, logo, colors	Not offered; resale explicitly barred without a separate data-reseller agreement

WHAT YOU GET WITH SENDKIT THAT APOLLO DOESN'T HAVE

- **An actual sending layer.** Dedicated IPs and isolated infrastructure on every plan, your cold volume never gambles the domain reputation your business runs on.
- **Blacklist monitoring.** Real-time alerts when any sending IP hits a blacklist. Absent from Apollo.
- **No 250-a-day gate.** Apollo caps Free and Basic at 250 emails/day and one mailbox; SendKit's sending scales with your mailboxes from the first plan.
- **Inbox placement testing.** Test inbox vs spam placement before each campaign. Absent from Apollo.

- **Per-mailbox auto-pause.** Apollo shows health scores and alerts; SendKit acts on a dropping mailbox before it burns.
- **AI reply agent.** Reads and tags every reply, auto-responds above your confidence threshold, Apollo's AI writes and researches, but reply handling stays manual.
- **New-gen CLI + MCP connection, unmetered.** Apollo shipping an MCP and CLI is real credit, but theirs drives the database, with credit-metered search and enrichment calls and unpublished, tier-varying rate limits. SendKit's drives the sending layer, campaigns, mailboxes, replies, reports, and a hundred other things from Claude, your terminal, or your own scripts, with no credit meter.
- **Flat, predictable pricing.** No per-seat math, no 3-seat minimums, no credit-system opacity, and no waiting until end-of-term to leave.

CLEAR EXPECTATIONS: WHAT YOU GET

- Low bounce rate and better deliverability
- Better time to lead from the reply agent and reply system
- Better white-label report system and custom GTM reporting
- Better inbox pricing and diversification across Google, Microsoft, and Azure mailboxes
- Better scaled pricing on higher volumes. The platform is made for scale
- Better advanced settings for sending management
- Faster inbox loading for faster time to lead
- Unlimited workspaces and team members with custom roles
- A way clearer, easier platform, built for heavy Claude users

WHERE APOLLO IS STRONG: The database and filtering are genuinely excellent ("ohh i love the filters" is a real review), the all-in-one consolidation is real value ("easily the best value in B2B prospecting right now"), sequencing is robust, onboarding is fast, and the MCP is free on every plan. Many teams keep Apollo for data and move the *sending* to real infrastructure, the two work fine together.

WHAT APOLLO USERS REPORT

G2 4.7/5 ACROSS 7,884 REVIEWS, 1,000 DISLIKE ANSWERS MINED 2026-07-12; TRUSTRADIUS 8.5/10 ACROSS 644 REVIEWS

- On G2, data quality is a top-3 dislike (75 mentions): "Some times the information is not accurate", alongside UI overwhelm (78) and support (69).
- **Data accuracy is the #1 complaint, cited by 29% of reviewers** in one TrustRadius segment: "10-15% of contacts have outdated information."
- **Bounces follow the stale data:** "email bounce rate is high"; "hurts deliverability if you're not scrubbing lists." One RevOps reviewer put it sharply: Apollo helps you spin up many emails "in a spammy manner instead of focusing on domain reputation."
- **Billing and renewals:** reviewers report auto-renewal charges after requesting cancellation and "no refund even when you cancel", consistent with the end-of-term-only cancellation policy on their own pricing FAQ.
- **Credit opacity:** "they need to explain better how credits work," alongside complaints about price increases.

Switching takes about 30 minutes. Campaigns, sequences, and leads move over via API key. Keep Apollo for data if you like it, point its exports at SendKit and send on infrastructure built for cold volume. Mailboxes bought through InboxKit move in one step. Want the step-by-step? Ask for the **Cold Email Platform Migration Kit**.
