

SENDKIT DOCS

How SendKit warm-up is different

Warm-up earns a new mailbox its reputation through a slow, steady exchange of real emails. It takes roughly two weeks and there is no shortcut. What differs between tools is what your mailbox exchanges with, how the ramp is tuned, and how honest the score is.

Two warm-up philosophies

Most tools warm mailboxes inside a large reward pool: a crowd of member mailboxes that open and reply to each other's warm-up traffic. That pool is only as good as its weakest members, and you cannot see inside it. SendKit warms your mailboxes against real, aged accounts in a high-quality seed pool used only with your mailboxes, so the reputation you earn is built on clean, real behavior rather than anonymous pool traffic.

Guardrails tuned per mailbox type

A new mailbox starts at 3 to 4 warm-up emails a day and ramps as its health score climbs, up to around 25 a day on Google mailboxes and 20 to 25 on Microsoft. Azure mailboxes deliberately start at 1 a day, because Microsoft's own sending limits are tighter and pushing hard early backfires faster than it does on Google. Warm-up runs every day, weekends included, because reputation building does not pause.

Full visibility into where warm-up lands

Every mailbox shows a health score built from where its warm-up emails actually land, inbox or spam, and how they are treated once they arrive. It will not show a perfect number on day one, because reputation moves slowly and a score that starts perfect is not measuring anything. If a warm-up email lands in spam, you see it, which tells you whether to slow down or rotate the domain instead of finding out weeks later that a campaign flopped.

Guardrails when health moves

Pause below 95

If a mailbox's health score drops below 95, cold sending from it pauses until the score recovers, so a wobble never becomes a burned domain.

Ready at 96 plus 14 days

Real sending starts once a mailbox holds a 96 health score and has warmed for at least two weeks. Both conditions matter.

Warm-up never stops

It keeps running alongside live campaigns, reinforcing reputation for as long as the mailbox sends. Turning it off mid-campaign is the fastest way to see scores slide.

One warm-up per mailbox

Never run two warm-up tools on the same mailbox. Doubled traffic confuses the reputation signal and can trigger the exact flags warm-up exists to avoid.

Watch your own warm-up health for two weeks

Connect a mailbox, let warm-up run, and check the health view daily. The honest climb from day one to the mid-90s is the whole point.
