Zero replies: work through this checklist in order

If a campaign has been running a while and replies still aren't coming in, don't guess at the cause. Work through these checks in order. Most issues show up in the first two or three steps.

Work through these checks in order

01 Check your bounce rate first

Open Email Insights and look at the bounce rate on the campaign. A bounce rate near zero rules out a broken list or a burned mailbox, and tells you the problem is downstream of delivery, not delivery itself.

02 Check the warm-up sent to reply ratio

Every mailbox keeps warming up in the background while it sends cold email. Compare warm-up emails sent to warm-up replies received. A healthy ratio means the mailbox is trusted by inbox providers; a weak ratio points to a reputation problem worth fixing before you touch campaign copy.

03 Look at who you're emailing

Check the recipient mix. Personal Outlook addresses (free consumer accounts, not business Microsoft 365 domains) are far more likely to land replies in spam than business inboxes. A list heavy on personal Outlook can explain a quiet inbox on its own.

04 Check hard bounces in Email Insights

Hard bounces mean the address doesn't exist. A cluster of hard bounces on one segment of the list usually means that segment needs revalidating before you send to it again.

05 Run an inbox placement test

If the first four checks look clean and replies are still quiet, run an inbox placement test. It tells you directly whether sends are landing in the primary inbox or spam, instead of leaving you to guess from reply counts alone.

What to expect

A campaign that's genuinely healthy (clean bounce rate, good warm-up ratio, mostly business recipients) usually ramps up within a week. If a week passes and those numbers are still off, that's the sign to keep working through the checklist above rather than wait longer.

WHY THIS WORKS ON SENDKIT

Every mailbox gets its own isolated IP and a real, unfaked health score, so when you check the warm-up ratio in step two, you're looking at data that reflects your sending alone, not a shared pool skewing the numbers.

Run the checklist on your quietest campaign

Open Email Insights on your quietest campaign and start with the bounce rate check, then work down the list in order.
